TEAM 3 – WHALE RIDERS

DAY 2 SESSION REPORT

1. Introduction

The Day 2 DevOps team session focused on practicing text-processing commands using the provided access.log file. Our team worked on a set of 30 questions and performed the commands in the EC2 terminal. During the session, we practiced grep and awk commands and were introduced to the cut command.

2. Topics Practiced and Learned

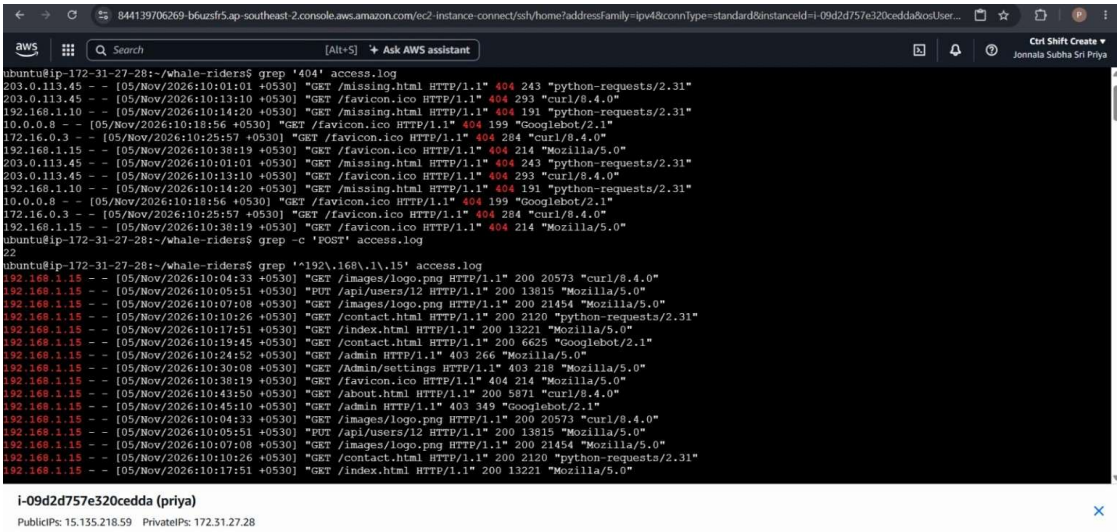

grep: We practiced searching for specific patterns and information in the log file, including status codes, IP addresses, and request details.

awk: We practiced extracting fields and analyzing log data. We also used awk for filtering records, counting status codes, and displaying selected information.

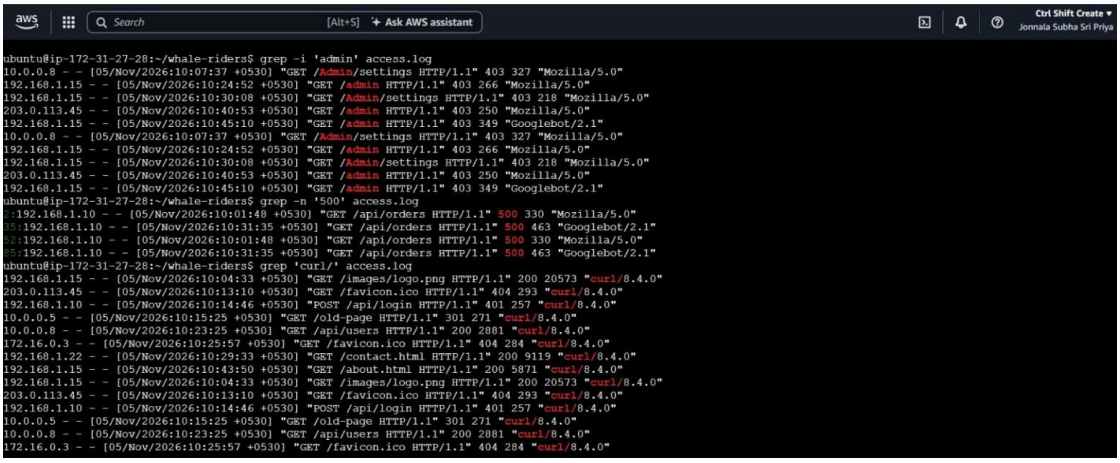

cut: The cut command was a new topic introduced during the session. We briefly learned how it can be used with delimiters and field numbers to extract specific parts of a line from a file.

3. EC2 Terminal Practice Screenshots

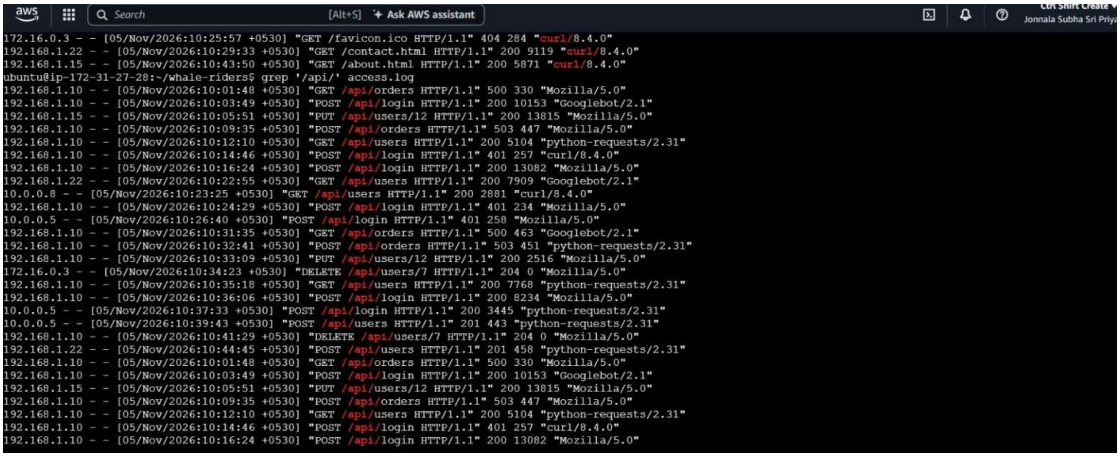

Here are the screenshots from our team's session practice.

4. Areas for Further Practice

We need more hands-on practice with the cut command to improve our understanding of delimiters and field extraction. We also need to practice more AWK commands, especially different conditions and field operations. Continued practice with these commands will help us use them more confidently during future sessions.

5. Conclusion

The Day 2 team session helped us gain hands-on practice with grep and awk commands and introduced us to the basics of the cut command. By working through 30 questions using the access.log file in the EC2 terminal, we improved our understanding of Linux text-processing commands and their practical use.
